Forms of use in mountain areas and associated problems are directly related to the level of development of the country. If mountain regions in developed countries are "distinguished" by economic backwardness, with social tensions and high rates of migration, it's the opposite case in developing countries. The mountain regions have already become tourist centers and are characterized by high standard of living.

The research discusses the theoretical foundations, principles and methodology of sustainable development, as well as the problems of sustainable development of certain regions in the world and in Georgia.

The paper also discusses the "Mountain Law" in Georgia, which has compared to the old "Law" of Georgia and with the "Mountain Law" of the world's highland developed countries.

The object of the research is the territory of Aspindza municipality, where as a result of During the research it was conducted field and office activities have been discussed all the problems which was presented in the research area. (here is consider Historical or Geographical processes that hindered the development of Aspindza Municipality)

As a result of the social survey, the development prospects of Aspindza municipality had discussed with the population.

Various tables and thematic maps in geoinformation systems (GIS) have been created as a result of existing and new information.
